

**Kicking Away the Ladder:
Neoliberals Rewrite History
By Ha-Joon Chang**

Monthly Review, Jan2003, Vol. 54 Issue 8, p10, 6p

There is currently great pressure on developing countries to adopt a set of “good policies” and “good institutions”—such as liberalization of trade and investment and strong patent law—to foster their economic development. When some developing countries show reluctance in adopting them, the proponents of this recipe often find it difficult to understand these countries’ stupidity in not accepting such a tried and tested recipe for development. After all, they argue, these are the policies and the institutions that the developed countries had used in the past in order to become rich. Their belief in their own recommendations is so absolute that, in their view, they must be imposed on the developing countries through strong bilateral and multilateral external pressures, even when these countries don’t want them. Naturally, there have been heated debates on whether these recommended policies and institutions are appropriate for developing countries. However, curiously, even many of those who are skeptical of the applicability of these policies and institutions to the developing countries take it for granted that these were the policies and the institutions that were used by the developed countries when they themselves were developing nations.

Contrary to the conventional wisdom, the historical fact is that the rich countries did not develop on the basis of the policies and the institutions that they now recommend to, and often force upon, the developing countries. Unfortunately, this fact is little known these days because the “official historians” of capitalism have been very successful in rewriting its history. Almost all of today’s rich countries used tariff protection and subsidies to develop their industries. Interestingly, Great Britain and the United States, the two countries that are supposed to have reached summit of the world economy through their free-market free-trade policies, are actually the countries that have most aggressively used protection and subsidies.

Contrary to the popular myth, Britain was an aggressive user, and in certain areas a pioneer, of activist policies intended to promote its industries. Such policies, although limited in scope, date back to the fourteenth century (Edward III) and the fifteenth century (Henry VII) in relation to woolen manufacturing, the leading industry of the time. England was then an exporter of raw wool to the Low Countries, and Henry VII, for example, tried to change this by taxing raw wool exports and poaching skilled workers from the Low Countries. Particularly between the trade policy reform of its first Prime Minister, Robert Walpole, in 1721 and its adoption of free trade around 1860, Britain used very state-directed trade and industrial policies, involving measures very similar to those used later by countries like Japan and Korea to develop their industries. During this period, it protected its industries more than did France, the supposed counterpoint to its free-trade free-market system. Friedrich List, the leading German economist of the mid-nineteenth century, argued that given this history, Britain preaching free trade to less advanced countries like Germany and the United States was like someone trying to “kick away the ladder” with which he had climbed to the top. List was not alone in seeing the matter in this light. Many American thinkers shared this view. Indeed, it was American

thinkers like Alexander Hamilton, the first Treasury Secretary of the United States, and the now-forgotten economist Daniel Raymond, who first systematically developed the infant industry argument. List, considered the father of the infant industry argument, started out as a free-trader (ardently supporting the Zollverein, a customs union which eliminated trade barriers among German states) and learned about this argument during his exile in the United States during the 1820s.

Little known today, the intellectual interaction between the United States and Germany during the nineteenth century did not end there. The German Historical School—represented by people like Wilhelm Roscher, Bruno Hildebrand, Karl Knies, Gustav Schmoller, and Werner Sombart—attracted a lot of American economists in the late nineteenth century. The patron saint of American neoclassical economics, John Bates Clark, in whose name the most prestigious award for young American economists is given today, went to Germany in 1873 and studied the German Historical School under Roscher and Knies, although he gradually drifted away from it. Richard Ely, one of the leading American economists of the time, also studied under Knies and influenced the American Institutionalist School through his disciple, John Commons. Ely was one of the founding fathers of the American Economic Association (AEA); to this day, the biggest public lecture at the Association's annual meeting is given in Ely's name, although few of the present AEA members would know who he was.

Between the Civil War and the Second World War, the United States had the most heavily protected economy in the world. Abraham Lincoln was a well-known protectionist who cut his political teeth under the charismatic politician Henry Clay in the Whig Party, which advocated the “American System” based on infrastructural development and protectionism. They understood that free trade was in the interests of Britain, but not the United States. One of Lincoln's top economic advisors was the famous protectionist economist, Henry Carey, who was described as “the only American economist of importance” by Marx and Engels in the early 1850s but has now been almost completely airbrushed out of the history of American economic thought. In protecting their industries, the Americans were going against the advice of such prominent economists as Adam Smith and Jean Baptiste Say, who saw the country's future in agriculture. However, the Americans knew exactly what they were doing. They understood that Britain had reached the top through protection and subsidies, and they needed to do the same if they were going to get anywhere. Criticizing the British preaching of free trade to his country, Ulysses S. Grant, the Civil War hero and U.S. president from 1868 to 1876, retorted that “within 200 years, when America has gotten out of protection all that it can offer, it too will adopt free trade.” When his country later reached the top after the Second World War, it too started “kicking away the ladder,” preaching free trade to the less developed countries and forcing them to accept it.

The United Kingdom and the United States make especially dramatic examples, but almost all the rest of the developed world today used tariffs, subsidies, and other means to promote their industries in the earlier stages of their development. Cases like Germany, Japan, and Korea are well known in this respect. But even Sweden, which later came to represent the “small open economy” to many economists, also strategically used tariffs, subsidies, cartels, and state support for research and development to develop key industries, especially textile, steel, and engineering. There were some exceptions, like the Netherlands and Switzerland, which have maintained free trade since the late eighteenth

century. However, these countries were already on the frontier of technological development by the eighteenth century and therefore did not need much protection. Also, it should be noted that the Netherlands deployed an impressive range of interventionist measures up until the seventeenth century in order to build up its maritime and commercial supremacy. At least both countries practiced what they preached, unlike today's developed nations, which often practice market-restricting policies despite their sermons of free markets. For example, Switzerland did not have a patent law until 1907, directly contradicting the emphasis today's orthodoxy puts on the protection of intellectual property rights. More interestingly, the Netherlands abolished its 1817 patent law in 1869 on the ground that patents are politically-created monopolies inconsistent with its free-market principles—a position that seems to elude most of today's free-market economists—and did not introduce another patent law until 1912. The story is similar in relation to institutional development.

Contrary to the advice the rich nations now give to the poor ones, in the earlier stages of their development, today's developed countries did not even have such "basic" institutions as professional civil service, central bank, and patent law. It was only after the Pendleton Act in 1883 that the U.S. federal government started recruiting its employees through a competitive process. The central bank, an institution dear to the heart of today's free-market economists, did not exist in most of today's rich countries until the early twentieth century—not least because the free-market economists of the day condemned it as a mechanism for unjustly bailing out imprudent borrowers. The U.S. central bank (the Federal Reserve System) was set up only in 1913, and the Italian central bank did not even have a note issue monopoly until 1926. Many countries allowed patenting of foreign invention until the late nineteenth century. As I mentioned above, Switzerland and the Netherlands refused to introduce a patent law despite international pressure until 1907 and 1912 respectively, and thus freely "stole" technologies from abroad. The examples can go on. One important conclusion that emerges from the history of institutional development is that it took the developed countries a long time to develop their economic institutions. Institutions typically took decades, and sometimes generations, to develop. Just to give one example, the need for central banking was perceived at least in some circles from at least the seventeenth century, but the first "real" central bank, the Bank of England, was instituted only in 1844, some two centuries later. Another important point is that the levels of institutional development in today's developed countries in the earlier period were much lower than those in today's developing countries. For example, measured by income level (an admittedly imperfect measure), in 1820, the United Kingdom was at a somewhat higher level of development than India today, but it did not have many of the most "basic" institutions that India has today. It did not have universal suffrage (not even universal male suffrage), a central bank, income tax, generalized limited liability, a generalized bankruptcy law, a professional bureaucracy, meaningful securities regulations, or even minimal labor regulations (except for a couple of minimal and hardly-enforced regulations on child labor).

If the policies and institutions that the rich countries are recommending to the poor countries are not those that they themselves used when they were developing, what is going on? We can only conclude that the rich countries are trying to kick away the ladder that allowed them to climb to where they are. It is no coincidence that economic

development has become more difficult during the last two decades, precisely when the developed countries increased the pressure on the developing countries to adopt neoliberal policies and institutions. During this period, the average annual per capita income growth rate for the developing countries has been half of the 3 percent achieved in the previous two decades (1960–1980). In particular, Latin America virtually stopped growing, while Sub-Saharan Africa and most ex-Communist countries have experienced a fall in absolute income. Economic instability has increased markedly, as manifested in the dozens of financial crises we have witnessed over the last decade alone. Income inequality has been growing in many developing countries and poverty has increased, rather than decreased, in a significant number of them.

What can be done to change this? First, the facts about the historical experiences of the developed countries should be more widely publicized. This is not just a matter of “getting history right,” but also of allowing the developing countries to make more informed choices. Second, the conditions attached to bilateral and multilateral financial assistance to developing countries should be radically changed. It should be accepted that the orthodox recipe is not working, and also that there can be no “best practice” policies that everyone should use. Third, the World Trade Organization rules should be rewritten so that the developing countries can more actively use tariffs and subsidies for industrial development. They should also be allowed to have less stringent patent laws and other intellectual property rights laws. Fourth, improvements in institutions should be encouraged, but this should not be equated with imposing a fixed set of institutions on all countries. Special care has to be taken not to demand excessively rapid upgrading of institutions by the developing countries, especially given that they already have quite developed institutions when compared to today’s developed countries at comparable stages of development, and given that establishing and running new institutions is costly. By being allowed to adopt policies and institutions that are more suitable to their conditions, the developing countries will be able to develop faster. This will also benefit the developed countries in the long run, as it will increase their trade and investment opportunities. That the developed countries cannot see this is the tragedy of our time.
